

Our team had a meeting today with clients to present our progress thus far on the BookList app. During our presentation, we read our mission statement aloud so that the customers could understand our motivation behind this app. We then explained how the app is being developed: it is being programmed with Swift for iOS devices and being integrated with Firebase to store user information. Users will be able to register using any gmail account, including an @sandiego.edu account. We then explained the app's functions, which allow users to post books for sale and search for books to purchase. Each listing contains the item's price and the seller's contact information.

The app that we presented upon today clearly resembles the app that we discussed in our second deliverable. We managed to stay consistent with all of our early functionality ideas like searching. However, our clients posed several good questions during our meeting that our team had not previously considered. We will have to deliberate and figure out how to implement suggested features, such as a request/buyer section of the app.
